Key features

Function

The piston speed of both advancing and retracting pneumatic cylinders, can be regulated using one-way flow control valves.

This is done through suitable restriction of the flow rate of compressed air in exhaust air or supply air direction. The non-return function works in the opposite direction.

The flow control function creates an adjustable annular gap inside the valve. This gap can be increased or decreased by turning the knurled screw or slotted head screw.

The required restriction can be set with the help of this adjustment element.

General information

Standard nominal flow rate q_{nN}

The standard nominal flow rate q_{nN} is the volumetric flow rate based on standard conditions at an operating pressure of $p_1 = 6$ bar and an output pressure of $p_2 = 5$ bar, measured at room temperature $t = 20^\circ\text{C}$.

Standard flow rate q_n

The standard flow rate q_n is measured at an operating pressure of $p_1 = 6$ bar and an output pressure with respect to atmospheric pressure ($p_2 = 0$ bar).
